

# RISKMASTER Business Intelligence

### AT A GLANCE

- Access to All Claim and Loss Data
- Extended Analysis of Data
- Creation of Complex Reports

### Designed for End Users

Raw data is of no use to business users. Data becomes useful only when it is packaged in a format that allows the user to comprehend the business value of the information derived from the data. This information is used to gain the knowledge and insight needed to take advantage of opportunities and mitigate future losses.

CSC has the information management tools that your business users need to make informed decisions. Our metadata and integration combined with the suite of products from Business Objects make it easy for you to mine through your data and understand your risks.

RISKMASTER Business Intelligence contains:

- Drag-and-drop report writing
- Report templates for pre-defined reports
- Metadata for tables
- Drill-down functionality
- Pop-up help.

Key business benefits:

- Allows users to get to the information that they need to effectively operate the business without having to contact an IT programmer, knowing the technical layout of the database or understanding how to construct complex RDBMS queries
- Provides data structures, procedures and tools already mapped to your RISKMASTER database
- Electronic report distribution over the Internet or private intranet through a browser

## **Business Objects Reporter/Explorer**

Business Objects is an easy-to-use and powerful business intelligence tool that enables users to access, analyze and share information stored in multiple data sources within and beyond the enterprise. Whether users want easy-to-use reference reports showing key indicators at a glance, or the ability to query and manipulate the results they see, Business Objects has all the functionality they need.

## **Business Objects InfoView—The Business Intelligence Portal**

InfoView is Web browser-based and, in essence, is a BI portal (BIP) to WebIntelligence and Business Objects documents and functionality for end users. A user interface that replaces a report catalog, the BIP goes further in that users can perform ad hoc querying, create reports and perform analytical functions. InfoView allows users to view, refresh, publish, send and save corporate and personal WebIntelligence and Business Objects documents that are stored in the Business Objects repository or in personal document storage areas. InfoView provides the ability for users to classify reports by category, store and display any document type, and perform a keyword search on documents stored in the Business Objects repository. InfoView also lets users manage, save, distribute, print and schedule documents for automated processing by Broadcast Agent.
